# Temperature upload over MQTT using Arduino UNO, ESP8266 and DHT22 sensor

## Introduction

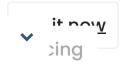

ThingsBoard is an open-source server-side platform that allows you to monitor and control IoT devices. It is free for both personal and commercial usage and you can deploy it anywhere. If this is your first experience with the platform we recommend to review <a href="https://www.what-is-thingsboard">what-is-thingsboard</a> page and <a href="https://getting-started">getting-started</a> guide.

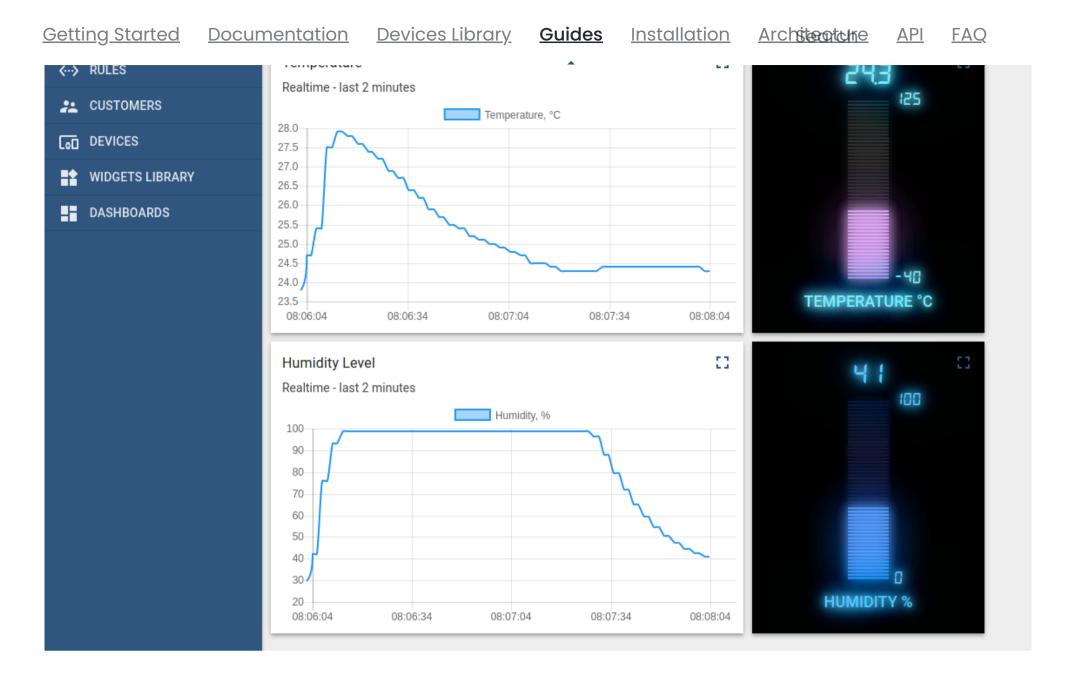

This sample application performs collection of temperature and humidity values produced by <u>DHT22 sensor</u> and further visualization on the real-time web dashboard. Collected data is pushed via MQTT to ThingsBoard server for storage and visualization. The purpose of this application is to demonstrate ThingsBoard <u>data collection API</u> and <u>visualization</u> <u>capabilities</u>.

The DHT22 sensor is connected to <u>Arduino UNO</u>. Arduino UNO connects to the WiFi network using <u>ESP8266</u>. Arduino UNO pushes data to ThingsBoard server via MQTT protocol by using <u>PubSubClient</u> library for Arduino. Data is visualized using built-in customizable dashboard. The application that is running on Arduino UNO is written using Arduino SDK which is quite simple and easy to understand.

Once you complete this sample/tutorial, you will see your sensor data on the following dashboard.

#### **Community Edition**

## **Prerequisites**

You will need to have ThingsBoard server up and running. The easiest way is to use <u>Live Demo</u> server.

The alternative option is to install ThingsBoard using <u>Installation Guide</u>. **Windows** users should follow this <u>guide</u>. **Linux** users that have docker installed should execute the following commands:

```
mkdir -p ~/.mytb-data && sudo chown -R 799:799 ~/.mytb-data

mkdir -p ~/.mytb-logs && sudo chown -R 799:799 ~/.mytb-logs

docker run -it -p 9090:9090 -p 7070:7070 -p 1883:1883 -p 5683-5688:5683-5688/udp -v ~/.mytb-

data:/data \
-v ~/.mytb-logs:/var/log/thingsboard --name mytb --restart always thingsboard/tb-postgres
```

These commands install ThingsBoard and load demo data and accounts.

ThingsBoard UI will be available using the URL: <a href="http://localhost:8080">http://localhost:8080</a>. You may use username tenant@thingsboard.org and password tenant. More info about demo accounts is available <a href="here">here</a>.

# List of hardware and pinouts

• Arduino UNO

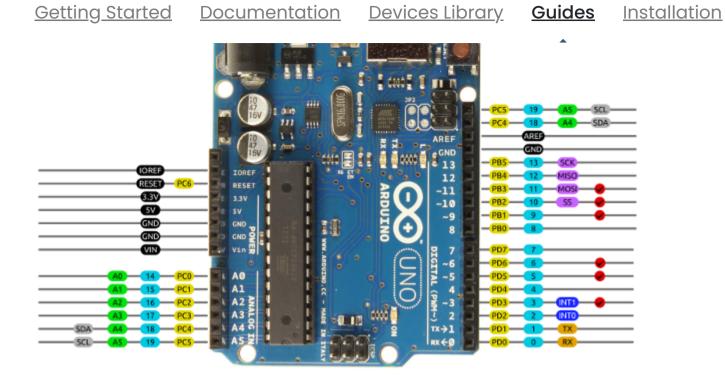

#### **Community Edition**

<u>FAQ</u>

<u>API</u>

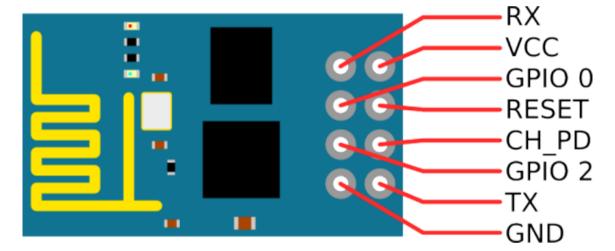

Archsteateme

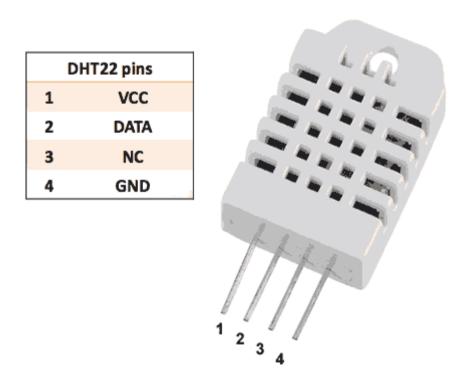

AVR DIGITAL ANALOG POWER SERIAL SPI (12C PWM INTERRUPT)

• ESP8266 module

• DHT22 sensor

- Resistor (between 4.7K and 10K)
- Breadboard
- 2 female-to-female jumper wires
- 11 female-to-male jumper wires
- 3 male-to-male jumper wire

Э

#### **Community Edition**

Getting Started Documentation Devices Library Guides Installation Architecture API FAQ

Please note that serial baud rate of ESP8266 should be set to 9600 by the following AT command:

AT+UART\_DEF=9600,8,1,0,0

# Wiring scheme

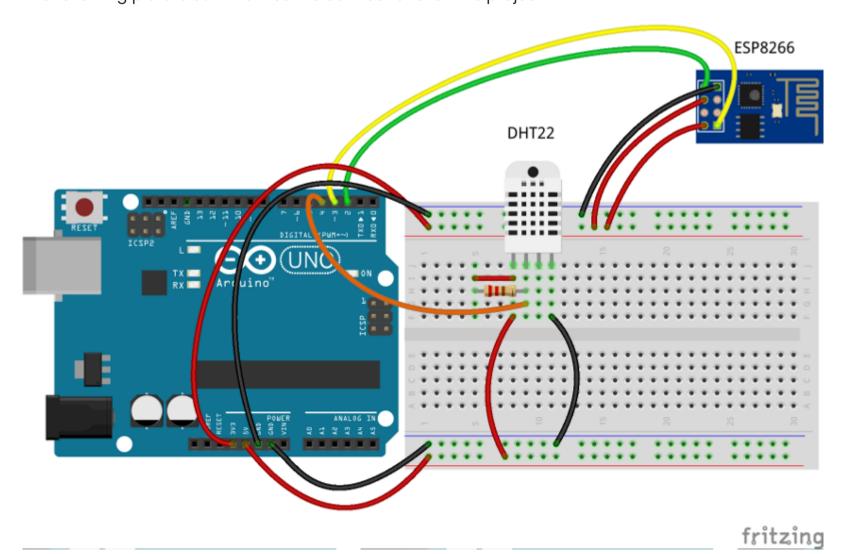

https://thingsboard.io/docs/samples/arduino/temperature/

Arduino UNO Pin	ESP8266 Pin
Arduino UNO 3.3V	ESP8266 VCC
Arduino UNO 3.3V	ESP8266 CH_PD
Arduino UNO GND	ESP8266 GND (-)
Arduino UNO D2	ESP8266 RX
Arduino UNO D3	ESP8266 TX

Arduino UNO Pin	DHT-22 Pin
Arduino UNO 5V	DHT-22 VCC
Arduino UNO GND	DHT-22 GND (-)
Arduino UNO D4	DHT-22 Data

Finally, place a resistor (between 4.7K and 10K) between pin number 1 and 2 of the DHT sensor.

The following picture summarizes the connections for this project:

#### **Community Edition**

Getting Started <u>Documentation</u> <u>Devices Library</u> <u>Guides</u> <u>Installation</u> <u>Architegature</u> <u>API</u> <u>FAQ</u>

## Provision your device

This step contains instructions that are necessary to connect your device to ThingsBoard.

Open ThingsBoard Web UI (http://localhost:8080) in browser and login as tenant administrator

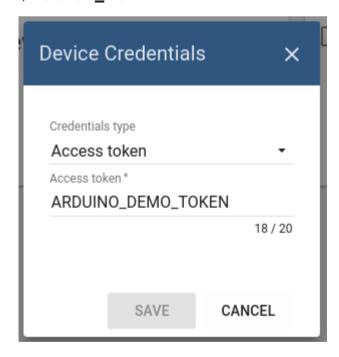

- login: tenant@thingsboard.org
- password: tenant

Go to "Devices" section. Click "+" button and create a device with the name "Arduino UNO Demo Device".

Once device created, open its details and click "Manage credentials".

Copy auto-generated access token from the "Access token" field. Please save this device token. It will be referred to later as **\$ACCESS\_TOKEN**.

## Provision your dashboard

Download the dashboard file using this <u>link</u>. Use import/export <u>instructions</u> to import the dashboard to your ThingsBoard instance.

# Programming the Arduino UNO device

If you already familiar with basics of Arduino UNO programming using Arduino IDE you can skip the following step and proceed with step 2.

Э

#### **Community Edition**

Getting Started <u>Documentation</u> <u>Devices Library</u> <u>Guides</u> <u>Installation</u> <u>Architegature</u> <u>API</u> <u>FAQ</u>

## Step 2. Install Arduino libraries.

Open Arduino IDE and go to Sketch -> Include Library -> Manage Libraries. Find and install the following libraries:

- PubSubClient by Nick O'Leary
- WiFiEsp by bportaluri
- Adafruit Unified Sensor by Adafruit
- DHT sensor library by Adafruit
- Arduino ThingsBoard SDK by ThingsBoard
- ArduinoJSON by bblanchon
- Arduino Http Client

**Note** that this tutorial was tested with the following versions of the libraries:

- PubSubClient 2.6
- WiFiEsp 2.1.2
- Adafruit Unified Sensor 1.0.2
- DHT sensor library 1.3.0
- Arduino ThingsBoard SDK 0.4
- ArduinoJSON 6.10.1
- Arduino Http Client 0.4.0

## Step 3. Prepare and upload a sketch.

Download and open arduino-dht-esp8266-mqtt.ino sketch.

Note You need to edit following constants and variables in the sketch:

- WIFI\_AP name of your access point
- WIFI\_PASSWORD access point password
- TOKEN the **\$ACCESS\_TOKEN** from ThingsBoard configuration step.
- thingsboardServer ThingsBoard HOST/IP address that is accessible from within your wifi network. Specify "demo.thingsboard.io" if you are using <u>live demo</u> server.

arduino-dht-esp8266-mqtt.ino

  13
           }
  13
```

Connect your Arduino UNO device via USB cable and select "Arduino/Genuino Uno" port in Arduino IDE. Compile and Upload your sketch to the device using "Upload" button.

After application will be uploaded and started it will try to connect to ThingsBoard node using mqtt client and upload "temperature" and "humidity" timeseries data once per second.

# Troubleshooting

When the application is running you can select "Arduino/Genuino Uno" port in Arduino IDE and open "Serial Monitor" in order to view debug information produced by serial output.

## Data visualization

Finally, open ThingsBoard Web UI. You can access this dashboard by logging in as a tenant administrator. Use

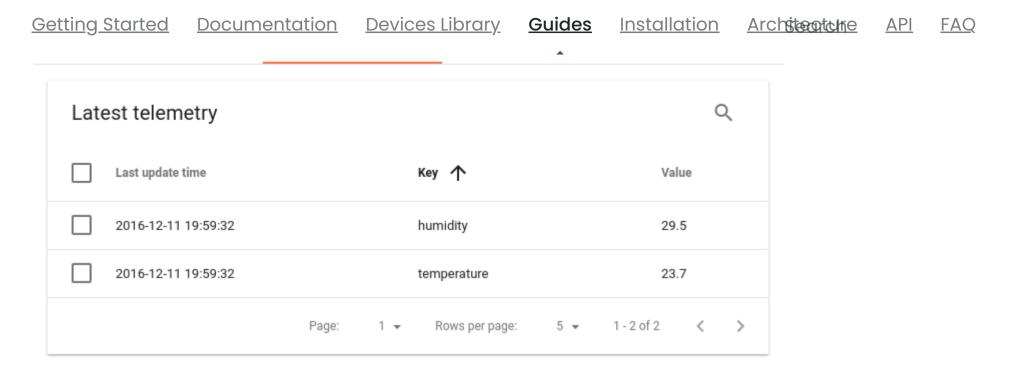

- login: tenant@thingsboard.org
- password: tenant

in case of local ThingsBoard installation.

Go to "Devices" section and locate "Arduino UNO Demo Device", open device details and switch to "Latest telemetry" tab. If all is configured correctly you should be able to see latest values of "temperature" and "humidity" in the table.

#### **Community Edition**

After, open "Dashboards" section then locate and open "Arduino DHT22: Temperature & Humidity Demo Dashboard". As a result, you will see two time-series charts and two digital gauges displaying temperature and humidity level (similar to dashboard image in the introduction).
